Automated lock code from Airbnb

Question

For the first time, I've set up my Yale Assure smart lock to automatically generate and send the lock code to our guests. They're arriving this afternoon and just now wrote me to say that they haven't received the code yet. I can see that the code has been properly set up and synced to the lock.

I've sent them the code manually, but where should I be pointing guests to to find the lock info? When is it sent to them? How can I word it clearer in my pre-arrival message so that they know where to look?

Hey OP, i have the august lock which uses the same configuration and I believe should have no difference with the yale. between 2-4 hours before the check-in time I see a notice in my chat with the guest that the door code has been shared. I cannot actually see what they see but I haven't had an issue with guests having access since I set this up. its possible that you will see the message in the next hour or so if you are in EST.

really easy.

We set up a scheduled message to send the night before check-in. This includes the door code, which you can do automatically with a "shortcode". No manual tweaking needed—it automatically sends the message with the code at the scheduled time. I guess this isn't strictly necessary since Airbnb will send them the code, but I think it provides extra peace of mind for travelers to know they have this info in advance.

Hi **/guest first name/**,
Your stay in **/city/** is approaching!
Check-in is **/check-in time/**. Your
check-out will be **/checkout date/** at
/checkout time/.

Your door code is **/door code/**. This
code will be active only during your
stay.

Let us know if you have any further
questions, or if there is anything we can
do to make your stay more
comfortable!

/door code/ is not a short code at all, at least for me. How do you set that up?

Ahh ok. Will have to give that a shot. I wanted to keep that all under my control

plmzdr • 1y ago

Just figured that Google Nest Yale cant be integrated with airbnb. Any other work around?

jtbandes • 1y ago

I can't speak to that limitation, but if you don't have a lock connected to Airbnb then there's no point in trying to use this shortcode, as it will only insert a code that Airbnb generated for a connected lock.

usually the 3rd digit of the 7 digit portion of the number. Then set when the code activates and deactivates. The codes can be set up weeks in advance. One thing we've learned is if the guest has repeating consecutive digits in their phone number like 555 or even 55 they have more trouble using the code, in that case we do something else, sometimes even asking the guest to give us a 6 digit number without consecutive repeating digits.

I concur on 4 of cell works for the guest and all of their party. If someone can sort out, it's their cell and the number and who is staying there. A rock is so much easier.

I need to ask one of my guests, I have the same system and have never had any issues. I know I am told when they get their code, which is usually the morning they are checking in, but...

StructuredKaos • 2y ago

I have home assistant change the door locks to the last four for the Airbnb users cell phone. Have not had any issues in 3 years.

We set up random 4 digit codes. We found that guests do not do well with anything longer.

We *NEVER* include their phone number; I've been asked a few times 'why' so:

Security Risks: Phone numbers are relatively easy to guess or obtain. If someone knows the guest's number, they could attempt unauthorized entry.

[Create](#)

Code Confusion: Some guests may not realize their phone number is the code, leading to frustration if they don't remember it or misunderstand which format to use (e.g., with or without area code).

Consistency: If the phone number changes (such as international guests using local numbers), it could create problems for both parties.

Lock System Compatibility: Not all lock systems are designed to handle unique codes for every guest, and phone numbers could create inconsistencies in how codes are generated or assigned.

My welcome messages let's guests know that their code with be the last 4 digits of their phone number on file for Airbnb. After 5 years, only 1 guest required assistance because they didn't know what number their had on file.

I used to give a random 4 digit number, but I found guests would consistently fumble with getting in during the first few days of their stay. When I switched to the last 4 of their phone number on file, this issue went away.

While some of these are legitimate "cons" of using the last 4 of a guests phone number, IMO the pros greatly outweigh it (far less likely to forget the code, feel more secure since they know it's unique, etc)
