Reliable House access

[Mihls](#) 1 November 17, 2024, 4:41pm

Ok, this might be considered old-fashioned but I have generally met guests to hand out the key. This has actually served a purpose but can also obviously be a pain.

Ok, so I am ready to upgrade and get a keyless lock, smart home -free, wifi free with the option of using a key. It has to be super reliable, is there such a thing?

Does anyone have experience of this?

Thanks in advance!

[Ichiu7](#) 2 November 17, 2024, 8:04pm

You will probably get many different responses to this but I went for a non ob-line solution using this deadbolt. [Kwikset SmartCode 270 Keyless Entry Electronic Touchpad Deadbolt Door Lock with Auto-Lock, Custom User Codes, Advanced Security in Venetian Bronze Traditional - Amazon.com](#) I just provide the code to the guest on the day of their arrival. It's worked fine for years and I have never had an issue. I decided against online solutions where I could change the code remotely etc. as it would just create more potential issues. Since installing this lock I have never seen my guests.

[Rolf](#) 3 November 17, 2024, 8:24pm

Ichiu7:

I decided against online solutions where I could change the code remotely

How do you give each guest their own unique entry code? How do you put start and end times on your smart lock (can anyone with the code you give them enter and leave at any time, days later for example)? I cannot imagine having a generic code that is shared with multiple guests, nor a generic code that allows a guest to check in perhaps days early or days late.

[Ritz3](#) 4 November 17, 2024, 9:03pm

I think I'm old fashion because I still use an old lock box. I don't trust the ones that connect to Wifi because in my area it goes out quite a bit with rain storms.

You do know that lack of wifi connection does nothing to your lock's ability to open and close? It does not need a wifi connection to work.

You only need a wifi connection when/if you want to change settings on the lock, or if you are actively monitoring its condition (locked or unlocked).

Conflating the weather in your area with the 'trustworthiness' of your lock's wifi connection is an invalid comparison.

[Ichiu7](#) 6 November 17, 2024, 9:27pm

I change the code for each guest and send them the code a few hours before they check-in. Then when they check out I change the code again. It only takes a about a minute.

[muddy](#) 7 November 17, 2024, 9:45pm

If I were a guest, I would want the door code more than a few hours before check-in. When people are travelling, their phone can run out of charge, if they are travelling internationally, their phone may not work in another country, they may not have data (so can't connect to Wifi to even see the code you sent. They could even break or lose their phone and not be able to call you.

If the code only gets activated at the earliest time the guest can check-in, it shouldn't matter if you send the code a day or two before.

[jaquo](#) 8 November 17, 2024, 10:00pm

I too don't use an online/wifi version - just a simple keycode lock.

I would only use a wifi lock if I lived within two minutes away from the rental OR had a great co-host who did.

This is because I had a neighbour who had a smart lock and he lived about half an hour away and had no co-host. Probably one third of guests had a problem with it - often because the battery on the phone needed charging or, in a couple of instances, they had old phones.

It wasn't the fault of the lock or the host - it was invariably the guest.

My neighbour had to drive from his home for one in every three guests.

3 Likes

[Mihls](#) 9 November 17, 2024, 10:25pm

Yes, that is the reason I do not want to use a Wifi operated device. It goes out too often in this area, especially during winter to be reliable. I do not live close by so having something that works without glitzes is paramount to me.

Kvikset 909 SmartCode Electronic Deadbolt and Schlage Touch Deadbolt (BE375) were recommended in a few places online as "*straightforward to use, with no need to configure apps, smart hubs, or deal with Wi-Fi issues, a modern, keyless entry system without complicated setup.*"

Hope it holds its claim!

Thanks for the input!

why would their phones have anything to do with the operation of a smart lock?

[jaquo](#) 11 November 17, 2024, 11:05pm

Rolf:

why would their phones have anything to do with the operation of a smart lock?

I don't know exactly because I've never used one.

But the one that my neighbour used had to be operated by the guest's phone which had to be connected to the internet. If the phone was dead, or an old phone, it wouldn't work.

[Rolf](#) 12 November 17, 2024, 11:21pm

That's pretty odd, I have never heard of any smart lock that works like that. All the smart locks I have ever heard of are standalone locks, and if they have wifi, or bluetooth, or any other communication part, it is simply a way to reprogram, or use as a remote entry key, etc.

LOL welcome to 2024!

[PitonView](#) 13 November 17, 2024, 11:41pm

All - Some smart locks have a program built into them that assign a code to a certain combination of start and stop times. It doesn't make any difference how far ahead of time you ask for the code and it doesn't need to contact "the mother ship" to get the code.

You go online to the lock portal and ask what the code is for the start date and time and the end date and time. If you want to change the code, you have to do that physically on the lock keypad. So that's not convenient for remote hosts to do for the guests, but it's straightforward for the guests to do.

For instance, we use ResortLock. Here are the directions to set a short code: "Press and hold * for about 2-3 seconds until you see a solid green light. Once you see the solid green light, enter the assigned code, then #, then enter your desired short code, followed by #. Finally, test the code to ensure it's working."

So you don't need the internet except to request the code to give the guest, or to monitor the activities on the lock.

Wow, that's not how it works at all. I have Resort Lock, and I have it connected to airbnb (they have an integration button on your Remote Lock app) so it automatically puts a code along with start and end times based on the reservation into the lock, and allows changes by simply typing in.

Programming a smart lock certainly can be done 'at the lock', but changing the times or code is easily and always done from your phone or computer.

RTFM is real, folks...

2 Likes

[PitonView](#) 15 November 18, 2024, 12:58am

Maybe we can't change it because we have an old version that isn't integrated with Airbnb. But my directions for changing the code came straight from the ResortLock site ([supportRmoteLock](#))

[Ichiu7](#) 16 November 18, 2024, 2:04am

One of the reasons why I chose a non WiFi lock was the cost But this thread got me thinking and now they appeared to have come down in cost.

[**Kwikset Halo Wi-Fi Smart Lock, Keyless Entry Door Deadbolt, Geofence...**](#)

Kwikset Halo Wi-Fi Smart Lock, Keyless Entry Door Deadbolt, Geofence Auto-Unlock, Grade AAA Certified, No Hub Easy Install, Matte Black Lifetime Finish Warranty, Backlit Keypad - Amazon.com

\$139.00

Not having working WiFi isn't an issue really since it just means that during the outage you cannot change the code or monitor its status. I presume that the code will be whatever you set it to previously. I might review my decision.

[Rolf](#) 17 November 18, 2024, 8:11am

PitonView:

But my directions for changing the code came straight from the ResortLock site

Yes, a smart lock is always programmable at the lock itself. But it certainly isn't the only way and certainly is not the primary way.

[Riverhouse](#) 18 November 18, 2024, 11:18am

I manage my AirBnB from about 5300 miles away and have been using a Schlage smart deadbolt lock for years now. Works great. Everyone gets their own code and it starts to work the afternoon of check in. I can also remotely open the door for the plumber or whatnot and lock up after they go. Also useful when guests forget to lock up. I replace the batteries every 6 months when I vacation there...

But then I also use smart switches, thermostats, alarm system, hot water etc. so am comfortable with the tech involved.

I always have an extra code in case internet is down when getting a last minute guest...

I did a very detailed review 2 years ago and went for the Lockly Vision Elite. One of the most expensive but very good reviews and features. Very happy with my choice. The charging of the battery is 5v so I have a power point near the hinge and it is on permanent charge.

- Family, caretaker, cleaner all access with finger print.
- Guests have a unique code restricted to their booking dates and time. I allocate over the internet at the time they book or pay. So maybe a year in advance.
- Has key access. So have a key safe with the key. If all else fails, I or the caretaker can give the guest the code for the key safe over the phone to access with the key.
- There is also a phone app access for guests but I do not use.
- There is a log and video of guests accessing the property which I can view over the internet.
- There is an auto lock function which you set to activate the dead lock after a period determined by you.
- You can open and lock the deadlock remotely over the internet so long as the door is closed.
- I can get notifications but have not set as I do not want to get a text message every time a guest unlocks the door during their stay.
- There are instruction videos you can sent to guests to show how to use the key pad.
- You can choose to sent the personalised access code by text message from the app when you add a guest. I only use it to give to trades men who need to have access on a one off basis. For guests I include the code in a confirmation email with other essential information.
- There is a new model out with facial recognition, but for our family and caretaker access happy with the finger print.

Only fault is the Lockly app does not have an adjustment for daylight saving, so either for guests arriving during daylight saving you have to add an hour to check-in and check out times or re-sync the app to GMT and then delete and re-enter all future guest access codes.

We have seven of these we have been using for about a decade on several rentals: [SCHLAGE FE595 CAM 609 ACC Camelot Keypad Entry with Flex-Lock and Accent Levers, Antique Brass - Door Levers - Amazon.com](#)? I change the guest code about every six months. Try as I might, I can't see any of our visitors sneaking back and into the rental in the off chance that they might find something to steal. We also have a separate code for my wife and I which only we know and opens each of the seven locks. You can program 4 different codes I think. That way you could have three codes that you rotate with your clients and the likelihood that a previous guest comes back and the code they used works is one in three chances.

1 Like

[jaquo](#) 23 November 24, 2024, 1:53am

Mongcon:

I change the guest code about every six months.

Can't you change it for every guest? I do. My average guest stay is three to four days (two rental apartments) so I'm changing codes almost every day.

This has nothing to do with previous guests sneaking back to steal stuff - it's to give every guest a sense of security knowing that the code is unique to them.

[Mongcon](#) 24 November 24, 2024, 2:30am

I could but choose not to. I don't see it as a problem. They have a deadbolt for nighttime security. No one has ever batted an eye. That said, I educate EVERY guest on how the little toggle on the inside above the handle should NOT be changed and it is NOT a lock. It actually turns off the locking mechanism. When they arrive and have let themselves in, I talk with them about a couple of idiosyncrasies about the rental and

tell them the story of the couple who dutifully flipped that toggle each night and slept blissful ly with the door unlocked. And got a laugh out of it when I showed them what they had done. That story, IMHO, is all the education that the guest needs to be assured of their security.

During the day it is just not plausible, given the situation with our rental, that a previous guest would use the code. I applaud your energy and diligence in changing the codes every day. I pick 4 digit codes that have an educational component to them, something that the guests will find more memorable than just a random set of four digits. That way, if they for some reason lose the code, they can remember the other significance of the code and figure out what it is if they can't reach me. Been working just fine for the last 9 years. I have stayed at Airbnbs where they used the last four digits of my phone number. Except, that's kind of the cyber equivalent of hiding a key under the doormat. It would be really easy for someone who did want to break in to figure out my phone number. There is the illusion of security and then there is actual security. I focus on the later.

[Rolf](#) 25 November 24, 2024, 3:16am

Mongcon:

How would it be really easy for someone to "figure out" your phone number?

[Mongcon](#) 27 November 24, 2024, 5:17am

In my experience, if a guest has forgotten something they contact me about it. We have cleaned the rental and if we find “forgotten” things we contact the guest and work something out. A returning guest who doesn’t contact me about a forgotten thing is not likely to just barge back in to a rental that is occupied. The problem of a guest using the code they were given to do something bad is just vanishingly improbable in my view.

[Mongcon](#) 28 November 24, 2024, 5:20am

I stay at an Airbnb. The nefarious local person knows about the Airbnb, knows that last four digits of the phone is used for the code. Stops by for some contrived reason, gets in a conversation and from the conversation learns where I am from, name(s), profession, can guess at age.

Finding a phone number with that kind of information is pretty easy.

1 Like

[michelynn](#) 29 November 24, 2024, 3:13pm

I also use the Schlage Camelot. The battery lasts at least 2 years so I change it once a year to insure it won’t ever die. The battery life is why I went with the non-wifi version. The WiFi lock my neighbor has needs new batteries every few months and You can’t open the lock if the battery dies. The Schlage does have a regular hard key slot in case the battery ever does die but I’ve never had to use it. It holds 19 codes. I use the last 4 digits of the guest’s phone number for each guest and program the lock as soon as I get a confirmed booking. I keep track on a spreadsheet that way my cleaner can delete or enter codes if I am travelling. Using the last 4 of the guest’s phone number makes it easy to use templates to send automated instructions to the guests since you don’t have to actually put a code in the message. Every so often I do a “delete all” and just re-enter the current codes to make sure I haven’t forgotten to delete someone’s code.

[Mongcon](#) 30 November 24, 2024, 3:35pm

All that makes a lot of sense. Yep, change the 9volt batteries once a year, along with batteries in any smoke detectors, etc. One of my instructions for every guest is to tell them to contact me if the light on the lock is blinking because that is the indication of a low battery. I learned that the hard way when the temp was -25, snowing and the guests couldn’t get in after late dinner at 11 pm. We have four rentals clustered together. I keep all the hard keys for the Schlage keypad locks in a central place, outside in a magnetic keybox, just in case. I didn’t realize that there were 19 possible codes! You learn something new every day, I thought it was just four. And you are right, that telling them the code is the last four of the phone number means you don’t

actually type the code. But again, in the unlikely event that some bad guy decides to try and break in one thing they would pursue is last four of the guest's phone because LOTS of hosts use that method and it's not lost on anyone who wants to break into STRs. One other thing about Schlage... fantastic warranty! Two of the locks failed and Schlage replaced them completely free with new ones. Doesn't get better than that. And they didn't make it difficult. And apropos of the ease of finding phone numbers... 7896

[michelynn](#) 31 December 23, 2024, 11:03pm

Could you please clarify "some bad guy decides to try and break in one thing they would pursue is last four of the guest's phone because LOTS of hosts use that method". I get that phone numbers are usually easy to find on google but how would anyone know the name of a guest?

[Mongcon](#) 32 December 23, 2024, 11:25pm

[muddy](#) 33 December 23, 2024, 11:34pm

??? What on earth are you talking about?

[michelynn](#) 34 December 24, 2024, 12:21am

I don't use my phone number. (None of those are mine anymore). I use the guest's phone number. How would a bad guy get the name of the guest?

[Mongcon](#) 35 December 24, 2024, 12:35am

A determined person could find the guest's name. I was just illustrating how easy it was to find your phone numbers. Please continue using guest's phone numbers if that works for you.

1 Like

[muddy](#) 36 December 24, 2024, 1:07am

Mongcon:

I was just illustrating how easy it was to find your phone numbers.

Easy- of course- her full name is on her profile here.

I can't imagine how a thief would get a guest's name, know what town they are from (there are many people with the same first and last names in thousands of cities and towns) in order to search for their phone number. Nor can I imagine any common thief being that determined. Thieves tend to target places that require the least amount of effort.

[Rolf](#) 37 December 24, 2024, 1:43am

The old "last 4 digits of the guest's name" has been shown to be an easily hacked number and in addition makes entry to an Airbnb a simple process for someone who knows the guest's info. A randomized number system, different every time, prevents many situations - for example "Oh yes, we are there every summer" becoming a potentially planned robbery.

Like the extra key in the lockbox or under the floor mat, security is threatened and I cannot imagine any guest feeling secure knowing that a number can not only be easily linked to the guest's private information, but also that it is repeatable over time with a return visit.

[Rolf](#) 38 December 24, 2024, 2:13am

I asked ChatGPT to explain why using a phone number for access is a bad idea!

Using the last 4 digits of a guest's phone number as the access code for an Airbnb is a terrible idea for several reasons:

1. **Security Risk:** Phone numbers are not secure information. They can be easily guessed or found out through social media or other means. Using them as an access code makes it too easy for someone to gain unauthorized access.
2. **Predictability:** Since phone numbers are typically 10 digits long and the last 4 digits only offer 10,000 possible combinations, this makes the access code highly predictable and easier for someone to crack.

3. **Lack of Privacy:** Sharing the last 4 digits of a guest's phone number as an access code can lead to privacy concerns. If someone were to overhear or see the code, they could potentially misuse the information.
4. **Repeat Guests:** If a guest has stayed at multiple Airbnbs that use the same method for access codes, it increases the likelihood that their code could be known to others.
5. **Professionalism:** It can come across as unprofessional and lazy. Guests expect that hosts take security seriously, and using a generic or easily guessable code can undermine their trust in the host's attention to detail and safety measures.

To ensure the safety and privacy of your guests, it's better to use a unique, randomized access code for each guest. This way, you can provide a secure and professional experience for everyone who stays at your property.

[muddy](#) 39 December 24, 2024, 2:45am

Rolf:

the last 4 digits only offer 10,000 possible combinations, this makes the access code highly predictable and easier for someone to crack.

Oh yeah, 10,000 possible combinations of numbers makes it highly predictable and easy to crack. I can easily imagine a thief standing at the door for 16 hours trying out several thousand possible number combinations.

[Lynick4442](#) 40 December 25, 2024, 4:38pm

I use key codes but selected locks that also have key access. The key access is in a lockbox on the front porch. So far no one has needed it (It's been 4 years) but it's there and all I have to do is tell them the code to get the keys.

1 Like

[muddy](#) 41 December 25, 2024, 5:51pm

I don't know if it's still there, but somewhere in Airbnb policy about check-in methods, I read at one time something about hosts having to provide a back-up method of entry in case the primary method failed for some reason.

[Rolf](#) 42 December 25, 2024, 5:52pm

muddy:

hosts having to provide a back-up method of entry in case the primary method failed for some reason

What would a backup method be for a metal key?

[muddy](#) 43 December 25, 2024, 6:23pm

Well, in my case, I have a set of "emergency keys" hidden in a plant pot that I point out to guests in case they lose the keys I give them, or accidentally lock the keys in their room, or are just the kind of people who hate having to keep track of keys.

Another back-up could simply be that the host makes sure they are reachable by phone, and if they don't live close enough to get there in 5 or 10 minutes to open the door, that guests have the number of a co-host, neighbor, etc. who also has a key.

I'm surprised by the number of posts I've read over the years from guests who had some difficulty getting in (they were given the wrong door code, or user error (they couldn't figure out how to use the lockbox or smartlock, or expected the door to just pop open when they entered the code, without turning the doorknob or pressing down the latch) and the host or property manager didn't answer the phone for hours.

As far as not functioning, there's very little that can go wrong with a metal key short of it getting bent or otherwise damaged.

[Mihls](#) 44 December 26, 2024, 1:14am

I have been following this discussion with great interest.

Next I'm really curious to know which particular lock/ model you're using? How long have you had it worry free?

[jaquo](#) 45 December 26, 2024, 6:30pm

Mihls:

I'm really curious to know which particular lock/ model you're using

Since 2015, I've used a basic keypad from Kwikset. The batteries are supposed to last for two years, but I change them anyway on the same date every year. (I use the 'used' batteries in remotes in my home) so they're trouble-free.

They do have a key option if anything goes wrong but I've never had to use the facility.

[Rolf](#) 46 December 26, 2024, 7:16pm

Smart locks have evolved a lot since they were first sold - the old ones held 4 or 8 codes, needed changing at the lock, and at the time few folks had interacted with them on homes - cranky guests who complain about things that are 'new' to them were loud and wanted 'the good old days'... Now, Airbnb provides integration with virtually all mfrs, and will assign and delete codes automatically based on your schedule.

The security hole provided with metal keys stuck under a doormat, rock, or lockbox is now seen by many guests as a negative.

[muddy](#) 47 December 26, 2024, 7:51pm

I hand the metal keys directly to the guests.

And while hiding them under the doormat is definitely insecure, not sure how them being in a lockbox with a code is.

Yeah, I know you have this idea that guests copy keys, but have you actually ever heard of a guest doing that and coming back to rob the place?

Funny how metal keys and lockboxes weren't complained about or considered insecure until smart locks came along.

And I have never had one guest who expressed any feeling of insecurity over having a physical key to enter. Would like to see some actual stats regarding "being seen by many guests as a negative".

[Rolf](#) 48 December 26, 2024, 8:03pm

muddy:

metal keys and lockboxes weren't complained about or considered insecure until smart locks came along.

The world moves forward; the famous speech about buggy whips from the movie "Other People's Money" comes to mind...

[muddy](#) 49 December 26, 2024, 8:13pm

Not a very good analogy. A company that doesn't invest in tech will be at a disadvantage with their competition. I don't think my guests book a place based on whether there's a physical key or a smart lock.

[Mihls](#) 50 December 27, 2024, 1:28pm

Jacuo, what model/number of the Kvikset lock do you have?

[jaquo](#) 51 December 27, 2024, 1:57pm

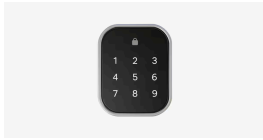

I'll check next time I'm doing a turnover. However, I doubt that the model is still available as they are nearly ten years old (a long time in product development).

I know that they were the cheaper ones though.

[Rolf](#) 52 December 27, 2024, 2:20pm

In the airbnb app they have a section of smart locks that work with airbnb (they will automate sending codes, putting them into/out of your lock, etc). They are very competitive in pricing. It changes everything when you don't have to run over to your airbnb and punch in codes, or delete codes... this is from airbnb

and walks you thru the process, and also shows you compatible locks. Check back here if you have questions on the process - I did it and it works perfectly.

[Connect a smart lock to Airbnb for smooth check-ins](#)

Guests receive their door code in an email right after they book, and they get a notification when it's time to check in. They can also find the code and lock instructions in their reservation details on Airbnb.

[michelynn](#) 53 December 31, 2024, 1:20am

Getting my number isn't actually easy. None of those phone numbers are mine

1 Like

[Hosterer](#) 54 January 2, 2025, 2:11pm

Which phone number do you use for your Airbnb host profile which is shown to all the guests?

Your phone number is only as secure as how serious anyone who knows it protects their electronic devices... If they get hacked, your information might have leaked as well. It has nothing to do with how well you protect YOUR information/devices. The issue is sharing the information with whatever website (FB, Amazon, Netflix etc.) when they get compromised - and this does happen frequently.

[Mihls](#) 55 January 2, 2025, 3:55pm

This forum has been very interesting to follow.

I have to admit that what still scares the heck out of me with smart locks is getting a faulty model or one that stops working after a short time, also documented.

I am pretty savvy with digital products and can figure out how to set codes etc. and if it worked would love it as a convenience but the problems reported are of enough concern to me. (9-13 % of Amazon feedback)

"Deadbolts spinning and not unlocking...the lock decides to stop working randomly... The lock completely disables itself if it loses Internet connection for 24hrs....

"It would decide to brick at super inconvenient times....resulted in us getting LOCKED OUT OF OUR HOUSE, and needing to call a locksmith, who had to drill our door to get us access."

I live hours away and this even as a remote possibility is too scary.

[michelynn](#) 56 January 2, 2025, 4:09pm

We use the Schlage Camelot because the battery lasts 2 years and there is a hard key that overrides the keypad if it does stop working. It doesn't have Internet capabilities which is why the battery lasts so long. I change it yearly when I change my smoke detector batteries. I have multiple ways to get into my house including a hard key in a hidden lock box but have never had to use them except once when a new cleaner locked the extra deadbolt. We have never had any problems with the Schlage Camelot lock.

[michelynn](#) 57 January 2, 2025, 4:15pm

The same is true for everyone you have ever given your phone number to. Use a password manager with zero-knowledge encryption (not Google), so you can use strong passwords and different ones for every account and you'll be fine.

I have a smart lock in use daily that has batteries that last over a year. For those who are unfamiliar with smart locks, they only access wifi when asked by an app or when they schedule checking for changes - for example, I have it set up to ping back to the software every few hours, and updates and changes are instant.

Which one are you using? I would love to get one I could reprogram key codes in remotely but I need the battery to last at least a year and none of the ones I've researched do.

I use this one:

[**KEYINCODE - Electronic & Mechanical Access Control Locks**](#)

Welcome to KEYINCODE. Our growing range of electronic and mechanical access control locks are designed to meet codes and standards for a range of applications and security needs.

and this software:

I use this one: Sifely Smart Lock, Keyless Entry Door Lock, Smart Deadbolt, Smart Door Lock, Deadbolt Lock, Digital Door Lock, Keypad Deadbolt Lock, Smart Locks Deadbolt, Door Locks with Deadbolt (Fob Supported)

I have a remote farmhouse rental and live 90 minutes away. Guests are given a code before check-in and told how to use it. The backup is that I can remotely unlock/lock it from my phone and the neighbor has a metal key. My housekeeper has her code and so do service workers. The app on my phone shows what code was used and at what time. It also shows the battery %. I have purchased these for my home as well.
